Premium performance

THE QUALITY AND DURABILITY OF THE LUCAS GAS SPRING MAKES IT YOUR BEST POSSIBLE CHOICE

Lucas gas spring are available for manufacture or replacement on most industrial, automotive, marine, agricultural and material handling applications.

Lucas gas spring are products of the highest quality on the market. Their manufacture has been subject to the strictest IAF 16949 : 2016. The highest standards of design and sustainability are assured for a total satisfaction of your customers.

Nitrited Rod

Optimal Corrosion & Durability Performance

Rubber Seal

Designed for High Durability Performance & Low Friction

Painted Metal Tube

Resistant to High Pressure & Corrosion

End Fittings

Various types of ultra durable joints special to application

Rod Guide Assembly

Durable Structure with Reduced Friction & Abrasionsure gas.

Piston Assembly

Engineered for High Mechanical Strength & Lifting Comfort

OUR RANGE GOES FURTHER

Recommendation and advices for using gas spring

Installation guide :

Always replace the gas spring in pairs for best performance and to prevent twisting due to uneven loading.

The cylinders incorporate a pressurized gas charge between 50 and 2500 Newton and cannot be compressed by hand.

Quick installation without any special tools.

A careful inspection of all hinges and connection points should be carried out for any signs of wear or fracture. These items should be replaced or repaired before installing the new gas springs.

Advice :

Before to ordering gas springs, control the following:

- Overall length from the center of the attachment to the center of the other attachment (in extension)
- Stroke
- End fittings
- Newton force

How to measure a Gas Spring

The overall length is measured with the steel rod fully extended, between the center of the two fixing studs. The stroke is measured between the top end of the tube and bellow the end fitting on the rod.

Installation instructions

Before removing old gas springs, review all supplied items to determine which components will be reused. Keep the hood, trunk or tailgate in the open position while replacing the struts.

**DO NOT REMOVE BOTH GAS SPRING AT THE SAME TIME.
REPLACE ONE, THEN THE OVER.**

Gas springs must be always mounted with the rod down when the tailgate is closed. This measure prevents the seals from drying out and ensures optimum product life. Contact us for horizontal mounting. *For more information, refer to the assembly instructions (P.90).*

Advice : *Be sure to operate the cylinder slowly two to three times during the first use.*

Lateral stress

The products mustn't endure any impacts, flexion and lateral stress in order not to weaken life expectancy of the product.

Please be sure to use the appropriate end fitting to minimize lateral stress.

Be careful, for appliances with welded yokes, allow for an operating clearance on the axis of 0.3 to 0.5mm and an operating clearance on each side of the yokes (0.5 to 1 mm).

Precautions in using

1. The state of piston rod surface and the seals are the mains elements of the gas springs. Impacts, sparks, paint and corrosives products are to be avoided.
Advice: Be careful, never tighten up the piston rod with a pliers or in a vice without using end protection made on lead, aluminum or copper.
2. Never open the gas spring without following the neutralization instructions, never expose the gas spring next to a heat source or throw it into a fire.
3. Our gas springs don't need any maintenance. The piston rod mustn't be lubricated with grease or oil. The gas springs are designed to operate for many years.

Product informations

1. The maximum numbers of opening and closing cycles per minute are 6. Please contact us for higher rate. The average resistance to endurance is 50,000 cycle. Loss of characteristics after average endurance (50 000 cycles): 15% max.
2. The temperature range is between 30°C and 80°C. Please contact us for higher or lower temperature range.

Reference temperature : 20°C Thrust variation due to the temperature 1% for 3°C.

Variation of the thrust based on the temperature

-30°C : Force (N) x 0.83

20°C : Force (N) x 1.00

80°C : Force (N) x 1.20

Storage conditions before utilisation

For a maximum period of 3 months, the products can be stored horizontally in a local with ambient temperature of 20°C. For a longer period of storing, plan a vertical storage, piston rod down.

After a storage for more than 6 months, it is necessary to operate the gas springs. During the first compression, the gas spring may require greater pressure force.

Neutralisation

Gas springs have a pressure between 20 and 180 bar, these products must be neutralize before scrap-
ping: lightly tighten the tube in a vise and saw it perpendicular to the tube axis in a area between 30 and 50 mm from the bottom of the tube. For this manipulation, you must wear glasses, use a hacksaw hand and place a cloth on the blade. As soon as you hear a whistle, stop sawing. Degassing is completed when the rod can be easily to manipulate by hand. Refer to the neutralization instruction.

Proceed the same way for gas springs locking www.lucasautomotive.com

Failure Diagnostic

Lucas's advices about the failure diagnostics

In order to facilitate the failure diagnoses for your customers, we have established a list of the most common refusals.

The cause of the claim provides a important basis of information on which we rely to begin researching for a warranty assessment the product failure. It must be accompanied by a visual inspection.

This examination will establish an accurate diagnosis and will help you to decide if you will accept the warranty or not.

After the examination of the piece, the Returns Support Department will reserves the right to validate or not the warranty.

An exact description of the problem is indispensable in order to address them.

I - Unit replacement

The replacement of the gas springs is done by pair in order to not create an imbalance of power. The absence of proof for a replacement in pairs will lead systematic refusal of the warranty or expertise.

II - Break of the thread

Our gas springs are made of high-quality steels. The rupture of thread is often not caused by a defect in quality, but rather due to:

1. End-Fitting incorrectly tightened during the assembly : this result in thread breakage to 1 or 2 mm from the strat of the rod.

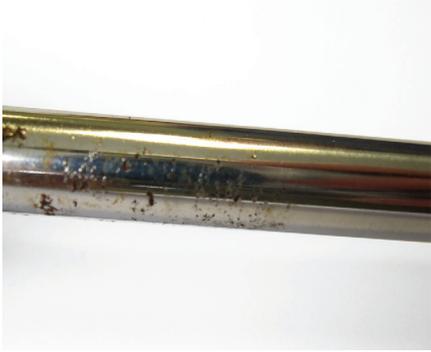

Solution : The End-fitting must be brought into contact of the rod or the tube.

2. Gas springs incorrectly lined up : this causes a lateral stress on the end-fitting and a stretching of the steel.

Solution : It is necessary to use a margin of functioning on the axis 0.3 to 05 mm and a margin of functioning on each side of the end-fitting from 0.5 to 1 mm.

III - Oxidization

Before the assembly, the rod undergoes a surface treatment to ensure good anti-corrosion strength.

Our QPQ rods (black nitriding) provide resistance to salt spray 10 times higher than the Chromium rods.

However, the gas springs are not designed to work in highly aggressive or corrosive environments.

The oxidization of the rod causes wear and tear on the seals assuring the sealing of the gas springs.

Solution : To increased longevity of the product, the stainless steel range is mandatory.

IV - Impact of the rod

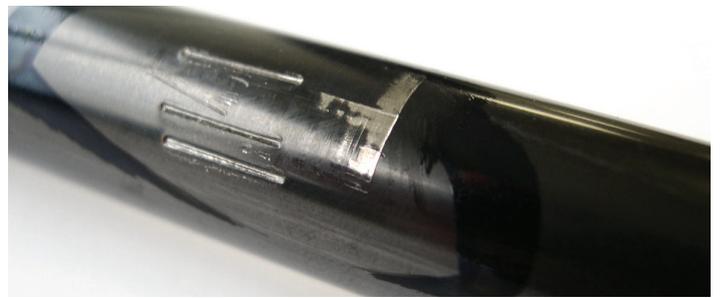

The surface of the rod undergoes a specific preparation to reduce its resistance on the bush and the seal, which ensures the Lucas gas springs on a very large number of cycles.

An impact on the rod leads either to a wear and a rupture of the seals assuring the sealing of the gas springs.

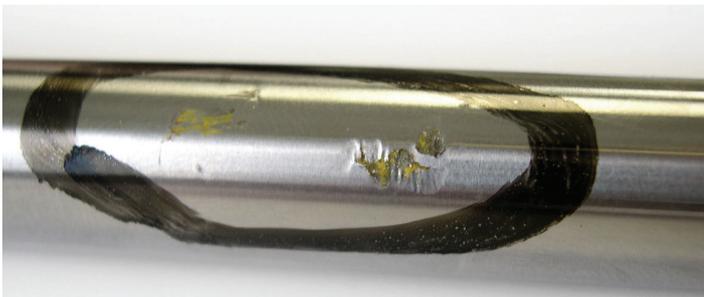

Solution : Do not, under any circumstances tightening the rod in a vice or with pliers. In addition, the rod should not suffer any shock.

Following an impact

Following an impact

Tightening with a vice

Tightening with a pliers

Failure Diagnostic

V - Lateral stress

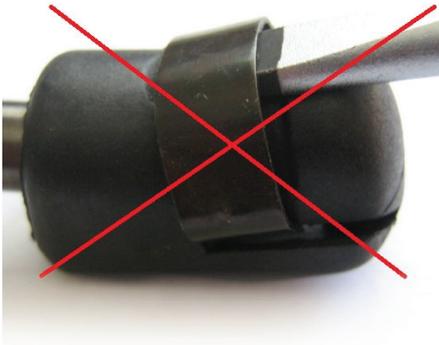

We speak about lateral stress when the rod is not working in a normal alignment. The lifetime of the gas springs is significantly reduced due to this problem.

The rod has unusual wear (bleaching) on the side where the friction is the most intense. The lateral stress leads to a bushing wear and a wear of the seal tube entry.

Solution : It is necessary to check the alignment, and if you need, change the end-fittings. It is necessary to use a margin of functioning on the axis 0.3 to 05 mm and a margin of functioning on each side of the end-fitting from 0.5 mm to 1mm max.

VI - Assembly of the ball joints

The use of any object aiming to separate or to take off the metal retaining ring may cause the deformation of the ball socket. The ball socket is no longer maintained on the bolt.

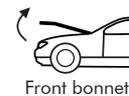

Solution : It is recommended during assembly of the gas springs, not to use objects (screwdriver, pliers) to separate the metal ring from its plastic or metal ball socket.

Indeed, a simple push of the palm of the hand is enough to set up the gas spring on the ball socket. Refer to the Gas spring assembly instruction (p.90).

Gas spring assembly

1

The gas springs must imperatively be mounted with the rod downwards when the hatch is closed.

2

Position the hole of the end fitting in front of the ball joint on the body word.

3

Do not remove or loosen the metal clip on the end fitting

4

A simple pressure with the palm of your hand is enough to put in place the gas spring on the ball joint

5

Position the hole of the end fitting in front of the ball joint on the hatch.

6

A simple pressure with the palm of your hand is enough to put in place the gas spring on the ball joint

7

The gas springs must imperatively be mounted with the rod downwards when the hatch is closed
